## UNIT \# 04

## GRADIANT DIVERGENCE AND CURL

## Introduction:

In this chapter, we will discuss about partial derivatives, differential operators Like Gradient of a scalar
,Directional derivative, curl and divergence of a vector .

## Partial Derivative:

Let $\overrightarrow{\mathrm{F}}$ be a vector function of independent scalar variable $\mathrm{x}, \mathrm{y}, \mathrm{z}$ as

$$
\overrightarrow{\mathrm{F}}=\mathrm{F}_{1}(\mathrm{x}, \mathrm{y}, \mathrm{z}) \hat{\imath}+\mathrm{F}_{2}(\mathrm{x}, \mathrm{y}, \mathrm{z}) \hat{\jmath}+\mathrm{F}_{3}(\mathrm{x}, \mathrm{y}, \mathrm{z}) \hat{\mathrm{k}}
$$

Then 1st Order partial derivatives w.r.t $\mathrm{x}, \mathrm{y}, \mathrm{z}$ are define as

$$
\begin{aligned}
& \frac{\partial \overrightarrow{\mathrm{F}}}{\partial \mathrm{x}}=\frac{\partial}{\partial \mathrm{x}} \mathrm{~F}_{1}(\mathrm{x}) \hat{\imath}+\frac{\partial}{\partial \mathrm{x}} \mathrm{~F}_{2}(\mathrm{x}) \hat{\jmath}+\frac{\partial}{\partial \mathrm{x}} \mathrm{~F}_{3}(\mathrm{x}) \hat{\mathrm{k}} \\
& \frac{\partial \overrightarrow{\mathrm{~F}}}{\partial \mathrm{y}}=\frac{\partial}{\partial \mathrm{y}} \mathrm{~F}_{1}(\mathrm{y}) \hat{\imath}+\frac{\partial}{\partial \mathrm{y}} \mathrm{~F}_{2}(\mathrm{y}) \hat{\jmath}+\frac{\partial}{\partial \mathrm{y}} \mathrm{~F}_{3}(\mathrm{y}) \hat{\mathrm{k}} \\
& \frac{\partial \overrightarrow{\mathrm{~F}}}{\partial \mathrm{z}}=\frac{\partial}{\partial \mathrm{z}} \mathrm{~F}_{1}(\mathrm{z}) \hat{\imath}+\frac{\partial}{\partial \mathrm{z}} \mathrm{~F}_{2}(\mathrm{z}) \hat{\jmath}+\frac{\partial}{\partial \mathrm{z}} \mathrm{~F}_{3}(\mathrm{z}) \hat{\mathrm{k}}
\end{aligned}
$$

( $\mathrm{y}, \mathrm{z}$ behave as a constant)
( $\mathrm{x}, \mathrm{z}$ behave as a constant)
( $\mathrm{x}, \mathrm{y}$ behave as a constant)

Higher order partial derivatives of $\overrightarrow{\mathrm{F}} \boldsymbol{w} . \boldsymbol{r} . \boldsymbol{t} \mathrm{x}, \mathrm{y}, \mathrm{z}$ are define in a similar way.
The vector Differential Operator Del ( $\vec{\nabla}$ ) :
A vector $\vec{\nabla}=\frac{\partial}{\partial x} \hat{\imath}+\frac{\partial}{\partial y} \hat{j}+\frac{\partial}{\partial z} \hat{k}$ is called Differential Operator Del $(\vec{\nabla})$.
Gradient of a scalar :
Let $\varphi(\mathrm{x}, \mathrm{y}, \mathrm{z})$ is a scalar function in a space. Then Gradient of a scalar is define as;

$$
\overrightarrow{\operatorname{Grad} \varphi}=\vec{\nabla} \varphi=\left(\frac{\partial}{\partial \mathrm{x}} \hat{\imath}+\frac{\partial}{\partial \mathrm{y}} \hat{\jmath}+\frac{\partial}{\partial \mathrm{z}} \hat{\mathrm{k}}\right) \varphi=\frac{\partial \varphi}{\partial \mathrm{x}} \hat{\imath}+\frac{\partial \varphi}{\partial \mathrm{y}} \hat{\jmath}+\frac{\partial \varphi}{\partial \mathrm{z}} \hat{\mathrm{k}}
$$

Properties of Gradient:
If $\varphi$ and $\Psi$ are scalar function and $c$ is constant then
(i) $\vec{\nabla}(\mathbf{c} \varphi)=c \vec{\nabla} \varphi$

Proof: We know that $\vec{\nabla}=\frac{\partial}{\partial \mathrm{x}} \hat{\mathrm{\imath}}+\frac{\partial}{\partial \mathrm{y}} \hat{\jmath}+\frac{\partial}{\partial \mathrm{z}} \hat{\mathrm{k}}$

Then $\vec{\nabla}(c \varphi)=\left(\frac{\partial}{\partial \mathrm{x}} \hat{\mathrm{l}}+\frac{\partial}{\partial \mathrm{y}} \hat{\jmath}+\frac{\partial}{\partial \mathrm{z}} \hat{\mathrm{k}}\right)(\mathrm{c} \varphi)=\boldsymbol{c} \frac{\partial \varphi}{\partial \mathrm{x}} \hat{\mathrm{\imath}}+\mathrm{c} \frac{\partial \varphi}{\partial \mathrm{y}} \hat{\jmath}+\mathrm{c} \frac{\partial \varphi}{\partial \mathrm{z}} \hat{\mathrm{k}}=\mathrm{c}\left(\frac{\partial \varphi}{\partial \mathrm{x}} \hat{\mathrm{\imath}}+\frac{\partial \varphi}{\partial \mathrm{y}} \hat{\jmath}+\frac{\partial \varphi}{\partial \mathrm{z}} \hat{\mathrm{k}}\right)=\boldsymbol{c} \vec{\nabla} \varphi$
(ii) $\vec{\nabla}(\varphi+\Psi)=\vec{\nabla} \varphi+\vec{\nabla} \boldsymbol{\Psi}$

Proof: We know that $\vec{\nabla}=\frac{\partial}{\partial \mathrm{x}} \hat{\mathrm{i}}+\frac{\partial}{\partial \mathrm{y}} \hat{\jmath}+\frac{\partial}{\partial \mathrm{z}} \hat{\mathrm{k}}$

Then

$$
\begin{aligned}
\vec{\nabla}(\varphi+\Psi) & =\left(\frac{\partial}{\partial \mathrm{x}} \hat{\imath}+\frac{\partial}{\partial \mathrm{y}} \hat{\jmath}+\frac{\partial}{\partial \mathrm{z}} \hat{\mathrm{k}}\right)(\varphi+\Psi)=\frac{\partial}{\partial \mathrm{x}}(\varphi+\Psi) \hat{\imath}+\frac{\partial}{\partial \mathrm{y}}(\varphi+\Psi) \hat{\jmath}+\frac{\partial}{\partial \mathrm{z}}(\varphi+\Psi) \hat{\mathrm{k}} \\
& =\left(\frac{\partial \varphi}{\partial \mathrm{x}} \hat{\imath}+\frac{\partial \varphi}{\partial \mathrm{y}} \hat{\jmath}+\frac{\partial \varphi}{\partial \mathrm{z}} \hat{\mathrm{k}}\right)+\left(\frac{\partial \Psi}{\partial \mathrm{x}} \hat{\imath}+\frac{\partial \Psi}{\partial \mathrm{y}} \hat{\jmath}+\frac{\partial \Psi}{\partial \mathrm{z}} \hat{\mathrm{k}}\right)=\vec{\nabla} \varphi+\vec{\nabla} \Psi
\end{aligned}
$$

(iii) $\vec{\nabla}(\varphi \Psi)=\varphi \vec{\nabla} \Psi+\Psi \vec{\nabla} \varphi$

Proof: We know that $\vec{\nabla}=\frac{\partial}{\partial \mathrm{x}} \hat{\mathrm{i}}+\frac{\partial}{\partial \mathrm{y}} \hat{\jmath}+\frac{\partial}{\partial \mathrm{z}} \hat{\mathrm{k}}$
Then $\vec{\nabla}(\varphi \Psi)=\left(\frac{\partial}{\partial \mathrm{x}} \hat{\mathrm{l}}+\frac{\partial}{\partial \mathrm{y}} \hat{\jmath}+\frac{\partial}{\partial \mathrm{z}} \hat{\mathrm{k}}\right)(\varphi \Psi)=\frac{\partial}{\partial \mathrm{x}}(\varphi \Psi) \hat{\imath}+\frac{\partial}{\partial \mathrm{y}}(\varphi \Psi) \hat{\mathrm{\jmath}}+\frac{\partial}{\partial \mathrm{z}}(\varphi \Psi) \hat{\mathrm{k}}$

$$
\begin{aligned}
& =\left[\varphi \frac{\partial \Psi}{\partial x}+\Psi \frac{\partial \varphi}{\partial \mathrm{x}}\right] \hat{\imath}+\left[\varphi \frac{\partial \Psi}{\partial y}+\Psi \frac{\partial \varphi}{\partial y}\right] \hat{\jmath}+\left[\varphi \frac{\partial \Psi}{\partial z}+\varphi \frac{\partial \varphi}{\partial z}\right] \hat{\mathrm{k}} \\
& =\varphi\left(\frac{\partial \Psi}{\partial \mathrm{x}} \hat{\imath}+\frac{\partial \Psi}{\partial y} \hat{\jmath}+\frac{\partial \Psi}{\partial z} \hat{\mathrm{k}}\right)+\Psi\left(\frac{\partial \varphi}{\partial \mathrm{x}} \hat{\imath}+\frac{\partial \varphi}{\partial y} \hat{\jmath}+\frac{\partial \varphi}{\partial \mathrm{z}} \hat{\mathrm{k}}\right)=\varphi \vec{\nabla} \Psi+\Psi \vec{\nabla} \varphi
\end{aligned}
$$

(iv) $\vec{\nabla}\left(\frac{\varphi}{\Psi}\right)=\frac{\Psi \vec{\nabla} \varphi-\varphi \vec{\nabla} \Psi}{\Psi^{2}}$

Proof: Let

$$
\vec{\nabla}\left(\frac{\varphi}{\Psi}\right)=\vec{\nabla}\left(\varphi \frac{1}{\Psi}\right)=\varphi \vec{\nabla}\left(\frac{1}{\Psi}\right)+\frac{1}{\Psi} \vec{\nabla} \varphi=\varphi\left(\frac{-1}{\Psi^{2}}\right) \vec{\nabla} \Psi+\frac{1}{\Psi} \vec{\nabla} \varphi=\frac{-\varphi \vec{\nabla} \Psi+\Psi \vec{\nabla} \varphi}{\Psi^{2}}=\frac{\varphi \vec{\nabla} \varphi-\varphi \vec{\nabla} \Psi}{\Psi^{2}}
$$

## Laplacian Operator:

If $\vec{\nabla}=\frac{\partial}{\partial \mathrm{x}} \hat{\mathrm{l}}+\frac{\partial}{\partial \mathrm{y}} \hat{\jmath}+\frac{\partial}{\partial \mathrm{z}} \hat{\mathrm{k}}$ Then $\quad \nabla^{2}=\frac{\partial^{2}}{\partial \mathrm{x}^{2}}+\frac{\partial^{2}}{\partial \mathrm{y}^{2}}+\frac{\partial^{2}}{\partial \mathrm{z}^{2}} \quad$ is called Laplacian Operator.
$\therefore\left\{\nabla^{2}=\vec{\nabla} \cdot \vec{\nabla}=\left(\frac{\partial}{\partial \mathrm{x}} \hat{\mathrm{i}}+\frac{\partial}{\partial y} \hat{\jmath}+\frac{\partial}{\partial \mathrm{z}} \hat{\mathrm{k}}\right) \cdot\left(\frac{\partial}{\partial \mathrm{x}} \hat{\mathrm{\imath}}+\frac{\partial}{\partial y} \hat{\jmath}+\frac{\partial}{\partial \mathrm{z}} \hat{\mathrm{k}}\right)=\frac{\partial^{2}}{\partial \mathrm{x}^{2}}+\frac{\partial^{2}}{\partial \mathrm{y}^{2}}+\frac{\partial^{2}}{\partial \mathrm{z}^{2}}\right\}$

## Laplacian Equation:

If $f(\mathrm{x}, \mathrm{y}, \mathrm{z})$ is function then Laplacian Equation is written as $\quad \nabla^{2} \mathrm{f}=0 \quad$ or $\quad \frac{\partial^{2} \mathrm{f}}{\partial \mathrm{x}^{2}}+\frac{\partial^{2} \mathrm{f}}{\partial \mathrm{y}^{2}}+\frac{\partial^{2} \mathrm{f}}{\partial \mathrm{z}^{2}}=0$.

Theorem: Prove that the gradient is a vector perpendicular to the level surface. $\varphi(\mathrm{x}, \mathrm{y}, \mathrm{z})=\mathrm{c}$
Proof: Let $\overrightarrow{\mathrm{r}}=\mathrm{x} \hat{\imath}+\mathrm{y} \hat{\mathrm{\jmath}}+\mathrm{z} \hat{\mathrm{k}}$ be a position vector of any point P on the given surface. Then

$$
\mathrm{dr}=\boldsymbol{d} \mathrm{x} \hat{\mathrm{\imath}}+\mathrm{dy} \hat{\jmath}+\mathrm{dz} \hat{\mathrm{k}} \text { is a tangent vector to surface at point } \boldsymbol{P}(\mathrm{x}, \mathrm{y}, \mathrm{z}) .
$$

We have to prove $\quad \overrightarrow{\operatorname{Grad} \varphi} \perp \mathrm{d} \overrightarrow{\mathrm{r}}$
Now as

$$
\varphi(\mathrm{x}, \mathrm{y}, \mathrm{z})=\mathrm{c}
$$

Then

$$
d \varphi=0
$$

By using calculus

$$
\begin{aligned}
& \text { lculus } \quad d \varphi=\frac{\partial \varphi}{\partial x} d x+\frac{\partial \varphi}{\partial y} d y+\frac{\partial \varphi}{\partial z} d z=0 \\
& \left(\frac{\partial \varphi}{\partial x} \hat{\imath}+\frac{\partial \varphi}{\partial y} \hat{\jmath}+\frac{\partial \varphi}{\partial z} \hat{k}\right) \cdot(d x \hat{\imath}+d y \hat{\jmath}+d z \hat{k})=0
\end{aligned}
$$

$$
\vec{\nabla} \varphi \cdot d \vec{r}=0
$$

$$
\overrightarrow{\operatorname{Grad} \varphi} \cdot d \vec{r}=0
$$

This show that $\overrightarrow{\operatorname{Grad} \varphi} \perp \mathrm{d} \overrightarrow{\mathrm{r}}$
Hence, Show that the gradient is a vector perpendicular to level surface at point $P(\mathrm{x}, \mathrm{y}, \mathrm{z})$.
Theorem: Prove that the gradient of a scalar function $\varphi(x, y, z)=c$ is a directional derivative of $\varphi$ perpendicular to the level surface at point $P$.

Proof: Let $P \& Q$ be the two neighboring points in a region of space.
Consider the level surfaces $\varphi(\mathrm{x}, \mathrm{y}, \mathrm{z})=\mathrm{c} \quad \boldsymbol{\&} \quad \varphi(\mathrm{x}, \mathrm{y}, \mathrm{z})=\mathrm{c}+\delta \mathrm{c}$ through $\boldsymbol{P} \& \boldsymbol{Q}$ respectively. Let the normal to the level surface through Pintersect the level surface through Q at point $\boldsymbol{P}$. Let $\widehat{\mathrm{s}}$ \& $\hat{\mathrm{r}}$ unit vectors along $\overrightarrow{\mathrm{PQ}} \& \overrightarrow{\mathrm{PR}}$.

We have to prove $\quad \frac{\mathrm{d} \varphi}{\mathrm{ds}}=\overrightarrow{\operatorname{Grad} \varphi} \cdot \hat{\mathrm{u}}$
Let $\quad \overrightarrow{\mathrm{PR}}=\delta \overrightarrow{\mathrm{r}} \quad \& \quad \overrightarrow{\mathrm{PQ}}=\delta \overrightarrow{\mathrm{s}} \quad$ then $\frac{\overrightarrow{\mathrm{PR}}}{\mathrm{PQ}}=\frac{\delta \mathrm{r}}{\delta \mathrm{s}}=\cos \theta$
Since $\quad \frac{\delta \varphi}{\delta s}=\frac{\delta \varphi}{\delta r} \cdot \frac{\delta r}{\delta s}=\frac{\delta \varphi}{\delta r} \cos \theta$
Applying limit when $P \rightarrow \mathrm{Q}$ then $\delta \mathrm{r} \rightarrow 0$

$$
\lim _{\delta r \rightarrow 0} \frac{\delta \varphi}{\delta s}=\lim _{\delta r \rightarrow 0} \frac{\delta \varphi}{\delta r} \cos \theta
$$

$$
\frac{\mathrm{d} \varphi}{\mathrm{ds}}=\frac{\mathrm{d} \varphi}{\mathrm{dr}} \cos \theta=\frac{\mathrm{d} \varphi}{\mathrm{dr}}|\hat{\mathrm{~s}}||\hat{\mathrm{r}}| \cos \theta=\frac{\mathrm{d} \varphi}{\mathrm{dr}}(\hat{\mathrm{~s}} . \hat{\mathrm{r}})=\hat{\mathrm{s}} . \hat{\mathrm{r}} \frac{\mathrm{~d} \varphi}{\mathrm{dr}}=\frac{\mathrm{d} \varphi}{\mathrm{ds}}=\overline{\operatorname{Grad} \varphi} \cdot \hat{\mathrm{s}}
$$

Here $\overrightarrow{\operatorname{Grad} \varphi}=\hat{\mathrm{r}} \frac{\mathrm{d} \varphi}{\mathrm{dr}}$. It is clear that $\overrightarrow{\operatorname{Grad} \varphi}$ lies in the directional of normal to the level surface
Type equation here.and measure the rate of change of $\varphi$ in that direction.

$$
\begin{aligned}
& \frac{\mathrm{d} \varphi}{\mathrm{ds}}=\frac{\partial \varphi}{\partial \mathrm{x}} \frac{\mathrm{dx}}{\mathrm{ds}}+\frac{\partial \varphi}{\partial \mathrm{y}} \frac{\mathrm{dy}}{\mathrm{ds}}+\frac{\partial \varphi}{\partial \mathrm{z}} \frac{\mathrm{dz}}{\mathrm{ds}}=\left(\frac{\partial \varphi}{\partial \mathrm{x}} \hat{\imath}+\frac{\partial \varphi}{\partial \mathrm{y}} \hat{\jmath}+\frac{\partial \varphi}{\partial \mathrm{z}} \hat{\mathrm{k}}\right) \cdot\left(\frac{\mathrm{dx}}{\mathrm{ds}} \hat{\imath}+\frac{\mathrm{dy}}{\mathrm{ds}} \hat{\jmath}+\frac{\mathrm{d} \mathrm{~d}}{\mathrm{ds}} \hat{\mathrm{k}}\right)=\vec{\nabla} \varphi \cdot \frac{\mathrm{dr}}{\mathrm{ds}} \\
& \text { Let } \frac{\mathrm{dr}}{\mathrm{ds}}=\hat{\mathrm{u}} \\
& \qquad \frac{\mathrm{~d} \varphi}{\mathrm{ds}}=\vec{\nabla} \varphi \cdot \hat{\mathrm{u}} \quad \Rightarrow \quad \frac{\mathrm{~d} \varphi}{\mathrm{ds}}=\overline{\operatorname{Grad} \varphi} \cdot \hat{\mathrm{u}}
\end{aligned}
$$

Hence proved that the gradient of a scalar function $\varphi(x, y, z)=c$ is a directional derivative of $\varphi$ perpendicular to the level surface at point $P$.

Example\#01: If $\varphi=\mathrm{x}^{2} \mathrm{z}+\mathrm{e}^{\mathrm{y} / \mathrm{x}}$. Find $\vec{\nabla} \varphi \&|\vec{\nabla} \varphi|$ at $(1,0,-2)$.
Solution: Given function $\quad \varphi=\mathrm{x}^{2} \mathrm{z}+\mathrm{e}^{\mathrm{y} / \mathrm{x}}$
We know that $\vec{\nabla} \varphi=\frac{\partial \varphi}{\partial \mathrm{x}} \hat{\mathrm{\imath}}+\frac{\partial \varphi}{\partial \mathrm{y}} \hat{\jmath}+\frac{\partial \varphi}{\partial \mathrm{z}} \hat{\mathrm{k}}=\frac{\partial}{\partial \mathrm{x}}\left(\mathrm{x}^{2} \mathrm{z}+\mathrm{e}^{\mathrm{y} / \mathrm{x}}\right) \hat{\imath} \hat{\mathrm{l}}+\frac{\partial}{\partial \mathrm{y}}\left(\mathrm{x}^{2} \mathrm{z}+\mathrm{e}^{\mathrm{y} / \mathrm{x}}\right) \hat{\jmath}+\frac{\partial}{\partial \mathrm{z}}\left(\mathrm{x}^{2} \mathrm{z}+\mathrm{e}^{\mathrm{y} / \mathrm{x}}\right) \hat{\mathrm{k}}$

$$
\vec{\nabla} \varphi=\left(2 x z+\mathrm{e}^{\mathrm{y} / \mathrm{x}} \cdot \frac{-\mathrm{y}}{\mathrm{x}^{2}}\right) \hat{\imath}+\left(\mathrm{e}^{\mathrm{y} / \mathrm{x}} \cdot \frac{1}{\mathrm{x}}\right) \hat{\jmath}+\left(\mathrm{x}^{2}\right) \hat{\mathrm{k}}
$$

$\boldsymbol{A t}(1,0,-2): \quad \vec{\nabla} \varphi=\left(2(1)(-2)+\mathrm{e}^{0 / 1} \cdot \frac{-0}{12}\right) \hat{\imath}+\left(\mathrm{e}^{0 / 1} \cdot \frac{1}{1}\right) \hat{\jmath}+\left(1^{2}\right) \hat{\mathrm{k}}=-4 \hat{\imath}+\hat{\jmath}+\hat{\mathrm{k}}$
Now $\quad|\vec{\nabla} \varphi|=\sqrt{(-4)^{2}+(1)^{2}+(1)^{2}}=\sqrt{16+1+1}=\sqrt{18}=3 \sqrt{2}$
Example\#02: Prove that $\vec{\nabla} \varphi(\mathrm{r})=\frac{\varphi^{\prime}(\mathrm{r}) \overrightarrow{\mathrm{r}}}{\mathrm{r}}$ use above result to evaluate the following.
(i) $\vec{\nabla} \mathrm{r}^{\mathrm{n}}$
(ii) $\vec{\nabla} \ln r$
(iii) $\nabla^{2}\left(\frac{1}{\mathrm{r}}\right)$

Solution: Let $\hat{\mathrm{r}}=\mathrm{x} \hat{\mathrm{i}}+\mathrm{y} \hat{\jmath}+\mathrm{z} \hat{\mathrm{k}}$ then $\mathrm{r}^{2}=\mathrm{x}^{2}+\mathrm{y}^{2}+\mathrm{z}^{2}----(i)$

$$
\left.\begin{array}{c}
\vec{\nabla} \varphi(\mathrm{r})=\frac{\partial \varphi(\mathrm{r})}{\partial \mathrm{x}} \hat{\imath}+\frac{\partial \varphi(\mathrm{r})}{\partial y} \hat{\jmath}+\frac{\partial \varphi(\mathrm{r})}{\partial \mathrm{z}} \hat{\mathrm{k}}=\left[\varphi^{\prime}(\mathrm{r}) \frac{\partial \mathrm{r}}{\partial \mathrm{x}}\right] \hat{\imath}+\left[\varphi^{\prime}(\mathrm{r}) \frac{\partial \mathrm{r}}{\partial \mathrm{y}}\right] \hat{\jmath}+\left[\varphi^{\prime}(\mathrm{r}) \frac{\partial \mathrm{r}}{\partial \mathrm{z}}\right] \hat{\mathrm{k}} \\
=\left[\varphi^{\prime}(\mathrm{r}) \frac{\mathrm{x}}{\mathrm{r}}\right] \hat{\imath}+\left[\varphi^{\prime}(\mathrm{r}) \frac{\mathrm{y}}{\mathrm{r}}\right] \hat{\jmath}+\left[\varphi^{\prime}(\mathrm{r}) \frac{\mathrm{z}}{\mathrm{r}}\right] \hat{\mathrm{k}}: \therefore\left\{2 \mathrm{r} \frac{\partial \mathrm{r}}{\partial \mathrm{x}}=2 \mathrm{From(i)} \Rightarrow \frac{\partial \mathrm{r}}{\partial \mathrm{x}}=\frac{\mathrm{x}}{\mathrm{r}} \text { Similarly } \frac{\partial \mathrm{r}}{\partial \mathrm{y}}=\frac{\mathrm{y}}{\mathrm{r}}, \frac{\partial \mathrm{r}}{\partial \mathrm{z}}=\frac{\mathrm{z}}{\mathrm{r}}\right\}
\end{array}\right\} \begin{gathered}
\mathrm{r} \frac{\varphi^{\prime}(\mathrm{r})[\mathrm{x} \hat{\imath}+\mathrm{y} \hat{\jmath}+\mathrm{z} \hat{\mathrm{k}}]}{\mathrm{r}}
\end{gathered}
$$

$$
\vec{\nabla} \varphi(\mathrm{r})=\frac{\varphi^{\prime}(\mathrm{r}) \overrightarrow{\mathrm{r}}}{\mathrm{r}} \quad \text { Hence proved. }
$$

(i) $\overrightarrow{\boldsymbol{\nabla}} \mathbf{r}^{\mathrm{n}}$

Solution: Let $\varphi(\mathrm{r})=\mathrm{r}^{\mathrm{n}} \quad$ then $\quad \varphi^{\prime}(\mathrm{r})=\mathrm{nr}^{\mathrm{n}-1}$
Using given equation.

$$
\vec{\nabla} \varphi(\mathrm{r})=\frac{\varphi^{\prime}(\mathrm{r}) \overrightarrow{\mathrm{r}}}{\mathrm{r}}=\frac{\left(\mathrm{nr}^{\mathrm{n}-1}\right) \overrightarrow{\mathrm{r}}}{\mathrm{r}} \Rightarrow \vec{\nabla} \mathrm{r}^{\mathrm{n}}=\mathrm{nr}^{\mathrm{n}-2} \overrightarrow{\mathrm{r}}
$$

(ii) $\vec{\nabla} \ln r$

Solution: Let $\varphi(\mathrm{r})=\ln \mathrm{r} \quad$ then $\quad \varphi^{\prime}(\mathrm{r})=\frac{1}{\mathrm{r}}$

Using given equation.

$$
\vec{\nabla} \varphi(\mathrm{r})=\frac{\varphi^{\prime}(\mathrm{r}) \overrightarrow{\mathrm{r}}}{\mathrm{r}}=\frac{\left(\frac{1}{\mathrm{r}}\right) \overrightarrow{\mathrm{r}}}{\mathrm{r}} \Rightarrow \vec{\nabla} \ln \mathrm{r}=\frac{1}{\mathrm{r}^{2}} \overrightarrow{\mathrm{r}}
$$

(iii) $\nabla^{2}\left(\frac{1}{\mathrm{r}}\right)$

Solution: Let $\quad \varphi(\mathrm{r})=\frac{1}{\mathrm{r}}=\mathrm{r}^{-1} \quad$ then $\quad \varphi^{\prime}(\mathrm{r})=(-1) \mathrm{r}^{-1-1} \neq-\mathrm{r}^{-2}$

## Using given equation

$$
\vec{\nabla} \varphi(\mathrm{r})=\frac{\varphi^{\prime}(\mathrm{r}) \overrightarrow{\mathrm{r}}}{\mathrm{r}}=\frac{\left(-\mathrm{r}^{-2}\right) \overrightarrow{\mathrm{r}}}{\mathrm{r}} \Rightarrow \vec{\nabla}\left(\frac{1}{\mathrm{r}}\right)=-\mathrm{r}^{-3} \overrightarrow{\mathrm{r}}=-\mathrm{r}^{-3}(\mathrm{X} \hat{\imath}+\mathrm{y} \hat{\jmath}+\mathrm{z} \hat{\mathrm{k}})=-\mathrm{r}^{-3} \mathrm{x} \hat{\imath}-\mathrm{r}^{-3} y \hat{\jmath}-r^{-3} \mathrm{z} \hat{\mathrm{k}}
$$

Now

$$
\begin{aligned}
\nabla^{2}\left(\frac{1}{r}\right) & =\vec{\nabla} \cdot \vec{\nabla}\left(\frac{1}{r}\right)=\left(\frac{\partial}{\partial x} \hat{\imath}+\frac{\partial}{\partial y} \hat{\jmath}+\frac{\partial}{\partial z} \hat{k}\right) \cdot\left(-r-3 x \hat{\imath}-r^{-3} y \hat{\jmath}-r^{-3} z \hat{k}\right) \\
& =\frac{\partial}{\partial x}\left(-r^{-3} x\right)+\frac{\partial}{\partial y}\left(-r^{-3} y\right)+\frac{\partial}{\partial z}\left(-r^{-3} z\right)=-\left[\frac{\partial}{\partial x}\left(r^{-3} x\right)+\frac{\partial}{\partial y}\left(r^{-3} y\right)+\frac{\partial}{\partial z}\left(r^{-3} z\right)\right] \\
& =-\left[\left(-3 r^{-4} \frac{\partial r}{\partial x} \cdot x+r^{-3} 1\right)+\left(-3 r^{-4} \frac{\partial r}{\partial y} \cdot y+r^{-3} \cdot 1\right)+\left(-3 r^{-4} \frac{\partial r}{\partial z} \cdot z+r^{-3} \cdot 1\right)\right] \\
& =-\left[-3 r^{-4} \frac{\partial r}{\partial x} \cdot x^{-}+r^{-3}-3 r^{-4} \frac{\partial r}{\partial y} \cdot y+r^{-3}+-3 r^{-4} \frac{\partial r}{\partial z} \cdot z+r^{-3}\right] \\
& =-\left[-3 r^{-4}\left\{\frac{\partial r}{\partial x} \cdot x+\frac{\partial r}{\partial y} \cdot y+\frac{\partial r}{\partial z} \cdot z\right\}+3 r^{-3}\right] \\
& =-\left[-3 r^{-4}\left\{\left(\frac{x}{r}\right) \cdot x+\left(\frac{y}{r}\right) \cdot y+\left(\frac{z}{r}\right) \cdot z\right\}+3 r^{-3}\right]\left\{2 r \frac{\partial r}{\partial x}=2 x \Rightarrow \frac{\partial r}{\partial x}=\frac{x}{r} \text { Similarly } \frac{\partial r}{\partial y}=\frac{y}{r}, \frac{\partial r}{\partial z}=\frac{z}{r}\right\} \\
& =-\left[-3 r^{-4}\left\{\frac{x^{2}}{r}+\frac{y^{2}}{r}+\frac{z^{2}}{r}\right\}+3 r^{-3}\right]=-\left[-3 r^{-4}\left\{\frac{x^{2}+y^{2}+z^{2}}{r}\right\}+3 r^{-3}\right] \\
& =-\left[-3 r^{-4}\left\{\frac{r^{2}}{r}\right\}+3 r^{-3}\right]=-\left[-3 r^{-4} \cdot r+3 r^{-3}\right]=-\left[-3 r^{-3}+3 r^{-3}\right]=-[0] \\
& \nabla^{2}\left(\frac{1}{r}\right)=0
\end{aligned}
$$

Example\#03:If $\varphi$ is a function of $\boldsymbol{u}$ and $\boldsymbol{u}$ is a function of $\mathrm{x}, \mathrm{y}, \mathrm{z}$ then show that $\vec{\nabla} \varphi=\frac{\partial \varphi}{\partial \mathrm{u}} \vec{\nabla} \mathrm{u}$
Solution: We know that $\vec{\nabla} \varphi=\frac{\partial \varphi}{\partial \mathrm{x}} \hat{\mathrm{i}}+\frac{\partial \varphi}{\partial \mathrm{y}} \hat{\mathrm{j}}+\frac{\partial \varphi}{\partial \mathrm{z}} \hat{\mathrm{k}}$
By using chain rule of differentiation

$$
\frac{\partial \varphi}{\partial x}=\frac{\partial \varphi}{\partial u} \cdot \frac{\partial u}{\partial x} \quad ; \quad \frac{\partial \varphi}{\partial y}=\frac{\partial \varphi}{\partial u} \cdot \frac{\partial u}{\partial y} \quad \& \quad \frac{\partial \varphi}{\partial z}=\frac{\partial \varphi}{\partial u} \cdot \frac{\partial u}{\partial z}
$$

Then $\quad \vec{\nabla} \varphi=\left(\frac{\partial \varphi}{\partial u} \cdot \frac{\partial u}{\partial x}\right) \hat{\imath}+\left(\frac{\partial \varphi}{\partial u} \cdot \frac{\partial u}{\partial y}\right) \hat{\jmath}+\left(\frac{\partial \varphi}{\partial u} \cdot \frac{\partial u}{\partial z}\right) \hat{k}=\frac{\partial \varphi}{\partial u}\left(\frac{\partial u}{\partial x} \hat{\imath}+\frac{\partial u}{\partial y} \hat{\jmath}+\frac{\partial u}{\partial z} \hat{k}\right)$

$$
\vec{\nabla} \varphi=\frac{\partial \varphi}{\partial \mathrm{u}} \vec{\nabla} \mathrm{u} \quad \text { Hence proved. }
$$

Example\#04: Find the scalar function $\varphi$ such that (i) $\vec{\nabla} \varphi=\mathrm{x} \hat{\mathrm{\imath}}+2 \mathrm{y} \hat{\jmath}+\mathrm{z} \hat{\mathrm{k}} \quad$ (ii) $\vec{\nabla} \varphi=2 \mathrm{r}^{4} \overrightarrow{\mathrm{r}}$
(i) $\vec{\nabla} \varphi=x \hat{\imath}+2 y \hat{\jmath}+z \hat{k}$

Solution: We know that $\quad \vec{\nabla} \varphi=\frac{\partial \varphi}{\partial \mathrm{x}} \hat{\imath}+\frac{\partial \varphi}{\partial \mathrm{y}} \hat{\jmath}+\frac{\partial \varphi}{\partial \mathrm{z}} \hat{\mathrm{k}} \quad$ then $\quad\left(\frac{\partial \varphi}{\partial \mathrm{x}} \hat{\imath}+\frac{\partial \varphi}{\partial \mathrm{y}} \hat{\jmath}+\frac{\partial \varphi}{\partial \mathrm{z}} \hat{\mathrm{k}}=\mathrm{x} \hat{\imath}+2 \mathrm{y} \hat{\jmath}+\mathrm{z} \hat{\mathrm{k}}\right.$ Comparing coefficients of $\hat{\mathrm{i}}, \hat{\jmath} \& \hat{\mathrm{k}}$

$$
\begin{array}{ll}
\frac{\partial \varphi}{\partial \mathrm{x}}=\mathrm{x} & \Rightarrow \varphi=\int \mathrm{x} \partial \mathrm{x} \Rightarrow \varphi_{1}=\frac{\mathrm{x}^{2}}{2}+c_{1}(\mathrm{y}, \mathrm{z}) \\
\frac{\partial \varphi}{\partial \mathrm{y}}=2 \mathrm{y} & \Rightarrow \varphi=2 \int \mathrm{y} \partial \mathrm{x} \Rightarrow \varphi_{2}=\mathrm{y}^{2}+c_{2}(\mathrm{x}, \mathrm{z})- \\
\frac{\partial \varphi}{\partial \mathrm{z}}=\mathrm{z} & \Rightarrow \varphi=\int \mathrm{z} \partial \mathrm{x} \Rightarrow \varphi_{3}=\frac{\mathrm{z}^{2}}{2}+c_{3}(\mathrm{x}, \mathrm{z})- \tag{iii}
\end{array}
$$

Adding (i),(ii) \& (iii) :

$$
\varphi_{1}+\varphi_{2}+\varphi_{3}=\frac{x^{2}}{2}+y^{2}+\frac{z^{2}}{2}+c_{1}(y, z)+c_{2}(x, z)+c_{3}(x, z)
$$

Hence

$$
\varphi=\left[\frac{\mathrm{x}^{2}}{2}+\mathrm{y}^{2}+\frac{\mathrm{z}^{2}}{2}\right]+\mathrm{c}
$$

(ii) $\vec{\nabla} \varphi=2 \mathbf{r}^{4} \overrightarrow{\mathbf{r}}$

$$

From (i), (ii) \& (iii): $\varphi=\frac{1}{2} \frac{\left(\mathrm{x}^{2}+\mathrm{y}^{2}+\mathrm{z}^{2}\right)^{-3 / 2}}{-3 / 2} \Rightarrow \varphi=-\frac{1}{3}\left\{\left(\mathrm{x}^{2}+\mathrm{y}^{2}+\mathrm{z}^{2}\right)^{1 / 2}\right\}^{-3}+\mathrm{c} \Rightarrow \varphi=\frac{1}{3} \mathrm{r}^{-3}+\mathrm{c}$

$$
\text { Hence } \varphi(r)=-\frac{1}{3 r^{3}}+\text { c }--------(a)
$$

At $\varphi(1)=0 \Rightarrow-\frac{1}{3(1)^{3}}+\mathrm{c}=0 \Rightarrow-\frac{1}{3}+\mathrm{c}=0 \Rightarrow \mathrm{c}=\frac{1}{3}$
Hence equation (a) will become

Solution: Given function $\varphi=x^{2}+y^{2}-\mathrm{z}$
We know that $\vec{\nabla} \varphi$ is perpendicular to the given surface. Therefore

$$
\begin{aligned}
\vec{\nabla} \varphi & =\frac{\partial \varphi}{\partial \mathrm{x}} \hat{\mathrm{\imath}}+\frac{\partial \varphi}{\partial \mathrm{y}} \hat{\jmath}+\frac{\partial \varphi}{\partial \mathrm{z}} \hat{\mathrm{k}} \\

& \overrightarrow{\operatorname{grad}} \varphi=[32-12] \hat{\imath}+[24] \hat{\jmath}+[96] \hat{k} \\
& \overrightarrow{\operatorname{grad}} \varphi=20 \hat{\imath}+24 \hat{\jmath}+96 \hat{k}
\end{aligned}
$$

Let $\overrightarrow{\mathrm{u}}=2 \hat{\imath}-3 \hat{\jmath}+6 \hat{\mathrm{k}}$ Then $\quad \hat{\mathrm{u}}=\frac{\overrightarrow{\mathrm{u}}}{|\overrightarrow{\mathrm{u}}|}=\frac{2 \hat{\imath}-3 \hat{\jmath}+6 \hat{\mathrm{k}}}{\sqrt{(2)^{2}+(-3)^{2}+(6)^{2}}}=\frac{2 \hat{1}-3 \hat{\jmath}+6 \hat{\mathrm{k}}}{\sqrt{4+9+36}}=\frac{2 \hat{\imath}-3 \hat{\jmath}+6 \hat{\mathrm{k}}}{\sqrt{49}}=\frac{2 \hat{1}-3 \hat{\jmath}+6 \hat{\mathrm{k}}}{7}$
Thus
Directional derivative of $\varphi$ at Point Pin the of $\overrightarrow{\mathrm{u}}=\overrightarrow{\operatorname{grad}} \varphi \cdot \hat{u}=(20 \hat{\imath}+24 \hat{\jmath}+96 \hat{\mathrm{k}}) \cdot \frac{(2 \hat{1}-3 \hat{\jmath}+6 \hat{\mathrm{k}})}{7}$

Q\#07: Evaluate the directional derivative of $\varphi=\mathrm{x}^{2}-\mathrm{y}^{2}+2 \mathrm{z}^{2}$ at $(1,2,3)$ in the direction of $\overrightarrow{\mathrm{PQ}}$ where $\boldsymbol{Q}$ has coordinates $(5,0,4)$

Solution: Given $\varphi=x^{2}-y^{2}+2 z^{2}$ Then

$$
\overrightarrow{\operatorname{grad}} \varphi=\vec{\nabla} \varphi=\frac{\partial \varphi}{\partial \mathrm{x}} \hat{\mathrm{\imath}}+\frac{\partial \varphi}{\partial \mathrm{y}} \hat{\jmath}+\frac{\partial \varphi}{\partial z} \hat{k}=\frac{\partial}{\partial \mathrm{x}}\left(\mathrm{x}^{2}-\mathrm{y}^{2}+2 \mathrm{z}^{2}\right) \hat{\mathrm{\imath}}+\frac{\partial}{\partial \mathrm{y}}\left(\mathrm{x}^{2}-\mathrm{y}^{2}+2 \mathrm{z}^{2}\right) \hat{\jmath}+\frac{\partial}{\partial \mathrm{z}}\left(\mathrm{x}^{2}-\mathrm{y}^{2}+2 \mathrm{z}^{2}\right) \hat{\mathrm{k}}
$$

$$
\overrightarrow{\operatorname{grad}} \varphi=(2 x) \hat{\imath}+(-2 y) \hat{\jmath}+(4 z) \hat{k}
$$

At $\quad \boldsymbol{P}(1,2,3): \quad \underset{\operatorname{grad}}{ } \varphi=[2(1)] \hat{\imath}+[-2(2)] \hat{\jmath}+[4(3)] \hat{\mathrm{k}}$

$$
\overrightarrow{\operatorname{grad}} \varphi=2 \hat{\imath}-4 \hat{\jmath}+12 \hat{k}
$$

$$
\text { Let } \overrightarrow{\mathrm{u}}=\overrightarrow{\mathrm{PQ}}=\mathrm{Q}(5,0,4)-\mathrm{P}(1,2,3)=(5-1) \hat{\imath}+(0-2) \hat{\jmath}+(4-3) \hat{\mathrm{k}}=4 \hat{\imath}-2 \hat{\jmath}+1 \hat{\mathrm{k}}
$$

Then $\hat{\mathrm{u}}=\frac{\overrightarrow{\mathrm{u}}}{|\overrightarrow{\mathrm{u}}|}=\frac{4 \hat{\imath}-2 \hat{\jmath}+1 \hat{\mathrm{k}}}{\sqrt{(4)^{2}+(-2)^{2}+(1)^{2}}}=\frac{4 \hat{\imath}-2 \hat{\jmath}+1 \hat{\mathrm{k}}}{\sqrt{16+4+1}}=\frac{4 \hat{1}-2 \hat{\jmath}+1 \hat{\mathrm{k}}}{\sqrt{21}}$

## Thus

(i) $\varphi=x+2 y-z$ at $P(1,4,0) \quad$ and $\overrightarrow{\mathbf{u}}=\hat{\mathbf{\jmath}}-\hat{\mathbf{k}}$

Solution: Given $\varphi=\mathrm{x}+2 \mathrm{y}-\mathrm{z}$ Then

$$
\begin{aligned}
\overrightarrow{\operatorname{grad}} \varphi & =\vec{\nabla} \varphi=\frac{\partial \varphi}{\partial \mathrm{x}} \hat{\imath}+\frac{\partial \varphi}{\partial y} \hat{\jmath}+\frac{\partial \varphi}{\partial z} \hat{\mathrm{k}}=\frac{\partial}{\partial \mathrm{x}}(\mathrm{x}+2 \mathrm{y}-\mathrm{z}) \hat{\imath}+\frac{\partial}{\partial \mathrm{y}}(\mathrm{x}+2 \mathrm{y}-\mathrm{z}) \hat{\jmath}+\frac{\partial}{\partial \mathrm{z}}(\mathrm{x}+2 \mathrm{y}-\mathrm{f}) \hat{\mathrm{k}} \\
& =1 \hat{\imath}+2 \hat{\jmath}-1 \hat{\mathrm{k}}

$$

Thus
Directional derivative of $\varphi$ at Point $P$ in the direction of $\vec{u}=\overrightarrow{\operatorname{grad}} \varphi \cdot \hat{u}=(1 \hat{\imath}+2 \hat{\jmath}-1 \hat{k}) \cdot \frac{\hat{\jmath}-\hat{k}}{\sqrt{2}}=\frac{0+2+1}{\sqrt{2}}=\frac{3}{\sqrt{2}}$
(ii) $\varphi=x^{2}+y^{2}+z^{2}$ at $P(2,0,3)$ and $\vec{u}=2 \hat{i}-\hat{\jmath}$

Solution: Given $\varphi=x^{2}+y^{2}+z^{2}$ Then

$$
\overrightarrow{\operatorname{grad}} \varphi=\vec{\nabla} \varphi=\frac{\partial \varphi}{\partial \mathrm{x}} \hat{\mathrm{\imath}}+\frac{\partial \varphi}{\partial \mathrm{y}} \hat{\mathrm{\jmath}}+\frac{\partial \varphi}{\partial \mathrm{z}} \hat{\mathrm{k}}=\frac{\partial}{\partial \mathrm{x}}\left(\mathrm{x}^{2}+\mathrm{y}^{2}+\mathrm{z}^{2}\right) \hat{\imath}+\frac{\partial}{\partial \mathrm{y}}\left(\mathrm{x}^{2}+\mathrm{y}^{2}+\mathrm{z}^{2}\right) \hat{\jmath}+\frac{\partial}{\partial \mathrm{z}}\left(\mathrm{x}^{2}+\mathrm{y}^{2}+\mathrm{z}^{2}\right) \hat{\mathrm{k}}

Then $\vec{\nabla} \varphi=\left[\frac{\partial}{\partial x} \hat{\imath}+\frac{\partial}{\partial y} \hat{\jmath}+\frac{\partial}{\partial z} \hat{k}\right]\left(3 x^{2} y\right)=\frac{\partial}{\partial x}\left(3 x^{2} y\right) \hat{\imath}+\frac{\partial}{\partial y}\left(3 x^{2} y\right) \hat{\jmath}+\frac{\partial}{\partial z}\left(3 x^{2} y\right) \hat{k}$

$$
\vec{\nabla} \varphi=6 x y \hat{\imath}+3 x^{2} \hat{\jmath}+0 \hat{k}
$$

\&

$$
\begin{aligned}
& \vec{\nabla} \psi=\left[\frac{\partial}{\partial \mathrm{x}} \hat{\mathrm{\imath}}+\frac{\partial}{\partial \mathrm{y}} \hat{\mathrm{\jmath}}+\frac{\partial}{\partial \mathrm{z}} \hat{\mathrm{k}}\right]\left(\mathrm{xz}^{2}-\mathrm{zy}\right) \\
& \vec{\nabla} \psi=\frac{\partial}{\partial \mathrm{x}}\left(\mathrm{xz}^{2}-\hat{z y}\right) \hat{\mathrm{i}}+\frac{\partial}{\partial \mathrm{y}}\left(\mathrm{xz}^{2}-\mathrm{zy}\right) \hat{\jmath}+\frac{\partial}{\partial \mathrm{z}}\left(\mathrm{xz}^{2}-\mathrm{zy}\right) \hat{\mathrm{k}} \\
& \vec{\nabla} \psi=\mathrm{z}^{2} \hat{\mathrm{i}}-\mathrm{z} \hat{\mathrm{j}}+(2 \mathrm{xz}-\mathrm{y}) \hat{\mathrm{k}}
\end{aligned}
$$

Now taking dot product of $\vec{\nabla} \varphi$ \& $\vec{\nabla} \psi$.
$\vec{\nabla} \varphi \cdot \vec{\nabla} \psi=\left[6 x y \hat{\imath}+3 x^{2} \hat{\jmath}+0 \hat{k}\right] \cdot\left[z^{2} \hat{\imath}-z \hat{\jmath}+(2 x z-y) \hat{k}\right]=6 x y z^{2}-3 x^{2} z$

## Now applying $\vec{\nabla}$ operator

$$
\begin{aligned}
\vec{\nabla}(\vec{\nabla} \varphi \cdot \vec{\nabla} \psi) & =\vec{\nabla}\left(6 x y z^{2}-3 x^{2} z\right)=\left[\frac{\partial}{\partial x} \hat{\imath}+\frac{\partial}{\partial y} \hat{\jmath}+\frac{\partial}{\partial z} \hat{k}\right]\left(6 x y z^{2}-3 x^{2} z\right) \\
& =\frac{\partial}{\partial x}\left(6 x y z^{2}-3 x^{2} z\right) \hat{\imath}+\frac{\partial}{\partial y}\left(6 x y z^{2}-3 x^{2} z\right) \hat{\jmath}+\frac{\partial}{\partial z}\left(6 x y z^{2}-3 x^{2} z\right) \hat{k} \\
\vec{\nabla}(\vec{\nabla} \varphi \cdot \vec{\nabla} \psi) & =\left(6 y z^{2}-6 x z\right) \hat{\imath}+\left(6 x z^{2}\right) \hat{\jmath}+\left(12 x y z-3 x^{2}\right) \hat{k}
\end{aligned}
$$

Q\#18: Show that $\vec{\nabla} f(r) \times \vec{r}=0$.
Solution: Let $\overrightarrow{\mathrm{r}}=\mathrm{x} \hat{\imath}+\mathrm{y} \hat{\jmath}+\mathrm{z} \hat{\mathrm{k}}$ then $\mathrm{r}^{2}=\mathrm{x}^{2}+\mathrm{y}^{2}+\mathrm{z}^{2}----(\boldsymbol{i})$
Then $\quad \vec{\nabla} f(r)=\left[\frac{\partial}{\partial \mathrm{x}} \hat{\mathrm{\imath}}+\frac{\partial}{\partial \mathrm{y}} \hat{\jmath}+\frac{\partial}{\partial z} \hat{k}\right] \mathrm{f}(\mathrm{r})$
$\therefore \vec{\nabla}=\frac{\partial}{\partial \mathrm{x}} \hat{\mathrm{\imath}}+\frac{\partial}{\partial \mathrm{y}} \hat{\jmath}+\frac{\partial}{\partial \mathrm{z}} \hat{\mathrm{k}}$
$=\frac{\partial}{\partial \mathrm{x}} \mathrm{f}(\mathrm{r}) \hat{\mathrm{\imath}}+\frac{\partial}{\partial \mathrm{y}} \mathrm{f}(\mathrm{r}) \hat{\jmath}+\frac{\partial}{\partial \mathrm{z}} \mathrm{f}(\mathrm{r}) \hat{\mathrm{k}}$
$=f^{\prime}(r) \frac{\partial r}{\partial y} \hat{\imath}+f^{\prime}(r) \frac{\partial r}{\partial y} \hat{\jmath}+f^{\prime}(r) \frac{\partial r}{\partial z} \hat{k}$
$=f^{\prime}(r)\left[\frac{x}{r} \hat{\imath}+\frac{y}{r} \hat{\jmath}+\frac{z}{r} \hat{k}\right]: \therefore\left\{\begin{array}{c}\text { From(i) Differentiate w.r.t } x \\ \left.2 r \frac{\partial r}{\partial x}=2 x \Rightarrow \frac{\partial r}{\partial x}=\frac{x}{r} \text { Similarly } \frac{\partial r}{\partial y}=\frac{y}{r}, \frac{\partial r}{\partial z}=\frac{z}{r}\right\}\end{array}\right\}$
$=f^{\prime}(r)\left[\frac{x \hat{i}+y \hat{\jmath}+z \hat{k}}{r}\right]$

$$
\vec{\nabla} f(r)=f^{\prime}(r) \frac{\vec{r}}{r}
$$

## Now taking cross product with $\overrightarrow{\mathrm{r}}$

$\vec{\nabla} f(r) \times \vec{r}=f^{\prime}(r) \frac{\vec{r}}{r} \times \vec{r}==\frac{f^{\prime}(r)}{r}(\vec{r} \times \vec{r})=\frac{f^{\prime}(r)}{r}(0)$
$\therefore \overrightarrow{\mathrm{r}} \times \overrightarrow{\mathrm{r}}=0$
$\vec{\nabla} f(r) \times \vec{r}=0$

## Hence proved.

Q\#19: Show that $(\vec{a} \cdot \vec{\nabla}) \vec{r}=\vec{a}$. Where $\vec{a}$ is a constant vector.
Solution: Let $\overrightarrow{\mathrm{a}}=\mathrm{a}_{1} \hat{\mathrm{i}}+\mathrm{a}_{2} \hat{\jmath}+\mathrm{a}_{3} \hat{\mathrm{k}} \quad$ \& $\quad \overrightarrow{\mathrm{r}}=\mathrm{x} \hat{\mathrm{i}}+\mathrm{y} \hat{\mathrm{\jmath}}+\mathrm{z} \hat{\mathrm{k}}$
We know that $\vec{\nabla}=\frac{\partial}{\partial x} \hat{1}+\frac{\partial}{\partial y} \hat{f}+\frac{\partial}{\partial z} \hat{k}$
Then $\quad \vec{a} \cdot \vec{\nabla}=\left(a_{1} \hat{\imath}+a_{2} \hat{\jmath}+a_{3} \hat{k}\right) \cdot\left(\frac{\partial}{\partial x} \hat{\imath}+\frac{\partial}{\partial y} \hat{\jmath}+\frac{\partial}{\partial z} \hat{k}\right)=a_{1} \frac{\partial}{\partial x}+a_{2} \frac{\partial}{\partial y}+a_{3} \frac{\partial}{\partial z}$
Now $\quad(\vec{a} \cdot \vec{\nabla}) \vec{r}=\left[a_{1} \frac{\partial}{\partial x}+a_{2} \frac{\partial}{\partial y}+a_{3} \frac{\partial}{\partial z}\right](x \hat{\imath}+y \hat{\jmath}+z \hat{k})$

$$
=a_{1} \frac{\partial}{\partial x}(x \hat{\imath}+y \hat{\jmath}+z \hat{k})+a_{2} \frac{\partial}{\partial y}(x \hat{\imath}+y \hat{\jmath}+z \hat{k})+a_{3} \frac{\partial}{\partial z}(x \hat{\imath}+y \hat{\jmath}+z \hat{k})
$$

$(\vec{a} \cdot \vec{\nabla}) \vec{r}=a_{1} \hat{\imath}+a_{2} \hat{\jmath}+a_{3} \hat{k}$
$(\vec{a} \cdot \vec{\nabla}) \vec{r}=\vec{a}$
Hence proved.

## Divergence of a Vector:

Le $\overrightarrow{\mathrm{F}}(\mathrm{x}, \mathrm{y}, \mathrm{z})$ is a vector .Then Divergence of a vector $\overrightarrow{\mathrm{F}}$ is defined as; $\quad$ Div $\overrightarrow{\mathrm{F}}=\vec{\nabla} \cdot \overrightarrow{\mathrm{F}}$.

## Solenoid Vector:

A vector $\overrightarrow{\mathrm{F}}$ is said to be Solenoid, if $\quad$ Div $\overrightarrow{\mathrm{F}}=0$.

## Properties of the Divergence:

If $\overrightarrow{\mathrm{a}} \& \overrightarrow{\mathrm{~b}}$ are two vector \& $\varphi$ is a scalar function then
(i) Div $(\vec{a}+\vec{b})=\vec{\nabla} \cdot(\vec{a}+\vec{b})=\vec{\nabla} \cdot \vec{a}+\vec{\nabla} \cdot \vec{b}$
(ii) $\operatorname{Div}(\varphi \vec{a})=\vec{\nabla} \cdot(\varphi \vec{a})=\varphi(\vec{\nabla} \cdot \vec{a})+(\vec{\nabla} \varphi) \cdot \vec{a}$

## Curl of a Vector:

Le $\overrightarrow{\mathrm{F}}(\mathrm{x}, \mathrm{y}, \mathrm{z})$ is a vector .Then Curl of a vector $\overrightarrow{\mathrm{F}}$ is defined as; Curl $\overrightarrow{\mathrm{F}}=\vec{\nabla} \times \overrightarrow{\mathrm{F}}$.

## Irrotational Vector:

A vector $\overrightarrow{\mathrm{F}}$ is said to be Irrotational, if $\operatorname{Curl} \overrightarrow{\mathrm{F}}=0$.

## Properties of the Curl:

If $\overrightarrow{\mathrm{a}} \& \overrightarrow{\mathrm{~b}}$ are two vector $\& \varphi$ is a scalar function then
(i) $\quad \operatorname{Curl}(\overrightarrow{\mathrm{a}}+\overrightarrow{\mathrm{b}})=\vec{\nabla} \times(\overrightarrow{\mathrm{a}}+\overrightarrow{\mathrm{b}})=\vec{\nabla} \times \overrightarrow{\mathrm{a}}+\vec{\nabla} \times \overrightarrow{\mathrm{b}}$
(ii) $\operatorname{Curl}(\varphi \vec{a})=\vec{\nabla} \times(\varphi \vec{a})=\varphi(\vec{\nabla} \times \vec{a})+(\vec{\nabla} \varphi) \times \vec{a}$
(iii) $\operatorname{Curl}(\overline{\operatorname{grad} \varphi})=\operatorname{Curl}(\vec{\nabla} \varphi)=\vec{\nabla} \times(\vec{\nabla} \varphi)=0$
(iv) $\operatorname{Curl}(\mathrm{Div} \overrightarrow{\mathrm{a}})=\operatorname{Curl}(\vec{\nabla} \cdot \overrightarrow{\mathrm{a}})=\vec{\nabla} \times(\vec{\nabla} \cdot \overrightarrow{\mathrm{a}})=0$

Theorems: If $\overrightarrow{\mathrm{F}} \& \overrightarrow{\mathrm{G}}$ are two vector functions. Then prove that
(i) $\vec{\nabla} \times(\vec{\nabla} \times \vec{F})=(\vec{\nabla} \cdot \vec{F}) \vec{\nabla}-\nabla^{2} \vec{F}$

Prove that $\vec{\nabla} \times(\vec{\nabla} \times \vec{F})=(\vec{\nabla} \cdot \vec{F}) \vec{\nabla}-\nabla^{2} \vec{F}$
Proof: We know that

Then

$$
\begin{aligned}
\overrightarrow{\mathrm{a}} \times(\overrightarrow{\mathrm{b}} \times \overrightarrow{\mathrm{c}}) & =(\overrightarrow{\mathrm{a}} \cdot \overrightarrow{\mathrm{c}}) \overrightarrow{\mathrm{b}}-(\overrightarrow{\mathrm{a}} \cdot \overrightarrow{\mathrm{~b}}) \overrightarrow{\mathrm{c}} \\
\vec{\nabla} \times(\vec{\nabla} \times \overrightarrow{\mathrm{F}}) & =(\vec{\nabla} \cdot \overrightarrow{\mathrm{F}}) \vec{\nabla}-(\vec{\nabla} \cdot \vec{\nabla}) \overrightarrow{\mathrm{F}} \\
\vec{\nabla} \times(\vec{\nabla} \times \overrightarrow{\mathrm{F}}) & =(\vec{\nabla} \cdot \overrightarrow{\mathrm{F}}) \vec{\nabla}-\nabla^{2} \overrightarrow{\mathrm{~F}} \quad \text { Here } \vec{\nabla} \cdot \vec{\nabla}=\nabla^{2}
\end{aligned}
$$

Example\#01: Find the divergence of $\vec{F}$ where $\vec{F}=\frac{x \hat{1}+y \hat{\jmath}+z \widehat{k}}{\left(x^{2}+y^{2}+z^{2}\right)^{3 / 2}}$
Solution: Given $\overrightarrow{\mathrm{F}}=\frac{\mathrm{x} \hat{\mathrm{\imath}}+\mathrm{y} \hat{\hat{\jmath}}+\mathrm{z} \hat{\mathrm{k}}}{\left(\mathrm{x}^{2}+\mathrm{y}^{2}+\mathrm{z}^{2}\right)^{3 / 2}}=\frac{\mathrm{x} \hat{\mathrm{\imath}}}{\left(\mathrm{x}^{2}+\mathrm{y}^{2}+\mathrm{z}^{2}\right)^{3 / 2}}+\frac{\mathrm{y} \hat{\mathrm{\jmath}}}{\left(\mathrm{x}^{2}+\mathrm{y}^{2}+\mathrm{z}^{2}\right)^{3 / 2}}+\frac{\mathrm{z} \hat{\mathrm{k}}}{\left(\mathrm{x}^{2}+\mathrm{y}^{2}+\mathrm{z}^{2}\right)^{3 / 2}}$
We know that $\quad \operatorname{Div} \overrightarrow{\mathrm{F}}=\vec{\nabla} \cdot \overrightarrow{\mathrm{F}}$

$$
\begin{aligned}

\end{aligned}
$$

$$
=\frac{\left(x^{2}+y^{2}+z^{2}\right)^{\frac{1}{2}}}{\left(x^{2}+y^{2}+z^{2}\right)^{3}}[0]
$$

Hence Div $\overrightarrow{\mathrm{F}}=0$

Q\#13: Show that $\overrightarrow{\mathrm{F}}=\frac{\overrightarrow{\mathrm{r}}}{\mathrm{r}^{2}}$ is an Irrotational vector also find $\varphi$, when $\overrightarrow{\mathrm{F}}=-\vec{\nabla} \varphi$ such that $\varphi(\mathrm{a})=0 .(a>0)$
Solution: : Let $\overrightarrow{\mathrm{r}}=\mathrm{x} \hat{\mathrm{i}}+\mathrm{y} \hat{\mathrm{j}}+\mathrm{z} \hat{\mathrm{k}} \quad \boldsymbol{\&} \quad \mathrm{r}^{2}=\mathrm{x}^{2}+\mathrm{y}^{2}+\mathrm{z}^{2}$

$$

For Irrotational vector, we have to prove Now $\operatorname{Curl} \overrightarrow{\mathrm{F}}=0$

$$
\operatorname{Curl} \overrightarrow{\mathrm{F}}=0
$$

Hence prove that $\overrightarrow{\mathrm{F}}=\frac{\overrightarrow{\mathrm{r}}}{\mathrm{r}^{2}}$ is an Irrotational vector.
Now we have find $\varphi$ for this given condition is $\quad \overrightarrow{\mathrm{F}}=-\vec{\nabla} \varphi \quad$ Then $\quad \vec{\nabla} \varphi=-\frac{\vec{r}}{\mathrm{r}^{2}}$

$$
\frac{\partial \varphi}{\partial \mathrm{x}} \hat{\mathrm{i}}+\frac{\partial \varphi}{\partial y} \hat{\jmath}+\frac{\partial \varphi}{\partial z} \hat{k}=-\frac{x \hat{\imath}+\hat{y}+z \hat{k} \hat{k}}{\partial x^{2}+y^{2}+z^{2}}=-\frac{x}{x^{2}+y^{2}+z^{2}} \hat{\imath}-\frac{y}{x^{2}+y^{2}+z^{2}} \hat{\jmath}-\frac{z}{x^{2}+y^{2}+z^{2}} \hat{k}
$$

## Comparing coefficients of $\hat{\mathrm{y}}, \hat{\jmath} \& \hat{\mathrm{k}}$

$\frac{\partial \varphi}{\partial \mathrm{x}}=-\frac{\mathrm{x}}{\mathrm{x}^{2}+\mathrm{y}^{2}+\mathrm{z}^{2}} \Rightarrow \varphi=-\frac{1}{2} \int \frac{2 \mathrm{x}}{\mathrm{x}^{2}+\mathrm{y}^{2}+\mathrm{z}^{2}} \partial \mathrm{x} \Rightarrow \varphi=-\frac{1}{2} \ln \left(\mathrm{x}^{2}+\mathrm{y}^{2}+\mathrm{z}^{2}\right)+\mathrm{c}_{1}(\mathrm{y}, \mathrm{z})-\cdots---(i)$
$\frac{\partial \varphi}{\partial y}=-\frac{y}{x^{2}+y^{2}+z^{2}} \Rightarrow \varphi=-\frac{1}{2} \int \frac{2 y}{x^{2}+y^{2}+z^{2}} \partial x \Rightarrow \varphi=-\frac{1}{2} \ln \left(x^{2}+y^{2}+z^{2}\right)+c_{2}(x, z)$
$\frac{\partial \varphi}{\partial \mathrm{z}}=-\frac{\mathrm{z}}{\mathrm{x}^{2}+\mathrm{y}^{2}+\mathrm{z}^{2}} \Rightarrow \varphi=-\frac{1}{2} \int \frac{2 \mathrm{z}}{\mathrm{x}^{2}+\mathrm{y}^{2}+\mathrm{z}^{2}} \partial \mathrm{x} \Rightarrow \varphi=-\frac{1}{2} \ln \left(\mathrm{x}^{2}+\mathrm{y}^{2}+\mathrm{z}^{2}\right)+\mathrm{c}_{3}(\mathrm{x}, \mathrm{z})$
From (i), (ii) \& (iii): $\quad \varphi=-\frac{1}{2} \ln \left(\mathrm{x}^{2}+\mathrm{y}^{2}+\mathrm{z}^{2}\right)+\mathrm{c}$
$\varphi=-\frac{1}{2} \ln \left(\mathrm{x}^{2}+\mathrm{y}^{2}+\mathrm{z}^{2}\right)+\mathrm{c} \Rightarrow \varphi=-\frac{1}{2} \ln \mathrm{r}^{2}+\mathrm{c}=-\frac{1}{2} \cdot 2 \ln \mathrm{r}+\mathrm{c} \Rightarrow \varphi(\mathrm{r})=-\ln \mathrm{r}+\mathrm{c}$
At $\varphi(\mathrm{a})=0 \Rightarrow-\ln \mathrm{a}+\mathrm{c}=0 \Rightarrow \mathrm{c}=\ln \mathrm{a}$
Hence equation (a) will become $\varphi(\mathrm{r})=\varphi(\mathrm{r})=-\ln \mathrm{r}+\ln \mathrm{a} \Rightarrow \varphi(\mathrm{r})=\ln \left(\frac{\mathrm{a}}{\mathrm{r}}\right)$
