Exercise 7.6 (Solutions)

TEXTBOOK OF ALGEBRA AND TRIGONOMETRY FOR CLASS XI Available online @ http://www.mathcity.org, Version: 1.0.0

1. A fair coin is tossed 30 times, the result of which is tabulated below. Study the table and answer the questions given below the table:

Event	Tally Marks	Frequency	
Head	and the set	14	
Tail	4444 1444 1444 I	16	

(i) How many times does 'head' appear?

MathCity.org

Merging man and maths

- (ii) How many times does 'tail' appear?
- (iii) Estimate the probability of the appearance of head?
- (iv) Estimate the probability of the appearance of tail?

**Solution**. From the table, total outcomes  $\pm 30 \implies n(S) = 30$ From the table, we see that

- (i) Let A = event the times head appears  $\implies n(A) = 14$
- (ii) Let B = event the times tail appears  $\implies n(B) = 16$
- (iii) Probability that head appears = P(A) =  $\frac{n(A)}{n(S)} = \frac{14}{30} = \frac{7}{15}$
- (iv) Probability that tail appears =  $P(B) = \frac{n(B)}{n(S)} = \frac{16}{30} = \frac{8}{15}$
- 2. A die is tossed 100 times. The result is tabulated below. Study the table and answer the questions given below the table:

Event	Tally Marks	Frequency	
1	1111 HHH 1811	14	
2	THE THE WE II	17	
3	WIL YHL YHL WIL	20	
4	THE THE THE H	18	
5	THE THE THE	15	
6	WE WE WE I	<b>16</b>	

- (i) How many times do 3 dots appear?
  - (ii) How many times do 5 dots appear?
  - (iii) How many times does an even number of dots appear?
  - (iv) How many times does a prime number of dots appear?
  - (v) Find the probability of each one of the above cases.

**Solution**. From the table, total outcomes =  $100 \implies n(S) = 100$ From the table, we see that

- (i) Let A = event, the number of times, 3 dots appear  $\Rightarrow$  n(A) = 20
- (ii) Let B = event, the number of times 5, dots appear  $\implies$  n(B) = 15
- (iii) Let C = event, the number of times, even dots appear

$$\Rightarrow$$
 n(C) = 17 + 18 + 16 = = 51

(iv) Let D = event, the number of times, prime dots appear

$$\Rightarrow$$
 n(D) = 17 + 15 + 20 = 52

(v) Required probabilities are as :

$$P(A) = \frac{n(A)}{n(S)} = \frac{20}{100} = \frac{1}{5} \qquad P(B) = \frac{n(B)}{n(S)} = \frac{15}{100} = \frac{3}{20}$$
$$P(C) = \frac{n(C)}{n(S)} = \frac{51}{100}, \qquad P(D) = \frac{n(D)}{n(S)} = \frac{52}{100} = \frac{13}{25}$$

3.

The eggs supplied	by a poultry	farm durin	g a week b	roke during
transit as follows:	1 %, 2%,	$1\frac{1}{2}\%, \frac{1}{2}\%,$	1 %, 2%,	, 1 %

Find the probability of the eggs broke in a day. Calculate the number of eggs that will be broken in transiting the following number of eggs:

9

(i) '	7,000 (ii)	<b>8,400</b> (iii) 10,5	500
Solution.	Transit	Broken eggs	No. of eggs
1993. 	1	1	100
	2	2	100
· · · · ·	3	$1\frac{1}{2} = 1.5$	100
	4	$\frac{1}{2} = 0.5$	100
	5	1	100
	6	2	100
	7	1	100
Total	eggs = n(S)	= 700	
		$xe \implies n(A) = 1+2$	+ 1.5 + 0.5 + 1 + 2 + 1 =
P(A)	$=\frac{n(A)}{n(S)}=\frac{1}{7}$	9 00	
(i) Numb	er of eggs broke	$e \text{ in } 7000 = 7000 \times \frac{9}{70}$	$\frac{1}{10} = 90$
	· ·		

(ii) Number of eggs broke in 8400 =  $8400 \times \frac{9}{700}$  = 108

(i)ii Number of eggs broke in 10500 =  $10500 \times \frac{9}{700}$  = 135

## § 7.7 ADDITION OF PROBABILITIES. Notations.

We know that P(E) means the probability of an event E.

Now if A and B are any two events, then

P(A) = probability of occurrence of the event A

P(B) = probability of occurrence of the event B

 $P(A \cup B)$  = probability of occurrence of the event A or B

 $P(A \cap B)$  = probability of occurrence of the event A and B

## Theorems of Addition of Probabilities.

I.  $P(A \cup B) = P(A \text{ or } B) = P(A) + P(B)$ , when A and B are disjoint

II.  $P(A \cup B) = P(A) + P(B) - P(A \cap B)$ , when A and B are overlapping

The only purpose of MathCity.org is to help students to learn mathematics. MathCity.org contains material for the students of F.Sc., B.Sc., M.Sc., M.Phil. and Ph.D, in the subject of mathematics.
